SERVICE OVERVIEW · NOVEMBER 2026

Start your read with the study prepared.

Retrospective preliminary EEG analysis by John Slayden, REEGT, NA-CLTM, for independent physician interpretation.

What your team receives

Prepared work	Purpose for the interpreting physician
Study context & technical review	Defined interval, available history, acquisition/display context, quality, and limitations.
Event index & annotations	Relevant observations organized by date, time, duration, pattern, clinical context, and source references.
Preliminary technical report	Background, salient findings, events, and limitations in a format agreed with your team.

Where the service fits

Completed routine, ambulatory, and long-term video-EEG studies, subject to agreed scope and technical compatibility. Useful for a defined backlog, overflow, or limited in-house analysis capacity.

A small paid first engagement

Request a quote for two to four studies, or ask about a single recording. The quote establishes the reviewed intervals, video requirements, report format, delivery date, fee, and included corrections. Availability is confirmed before booking.

Before clinical work begins

Confirm approved access, platform compatibility, required agreements, information-handling terms, physician responsibility, insurance requirements, and the route for time-sensitive findings.

An accountable handoff

John brings hospital and remote EEG experience since 2014, including review, annotation, artifact discrimination, and technologist education. The interpreting physician retains independent review, clinical correlation, final interpretation, and sign-off.

Retrospective analysis; continuous surveillance and emergency response are outside this offer. No measured time-saving or diagnostic-performance claim is made.
